ABSTRACT OF THE INVENTION

The present invention relates to a radiolabeled DNA carrier, a method of preparation thereof and the therapeutic of this substance uses to uncontrolled cellular proliferation. The invention relates to devices incorporating the also radiolabeled DNA carrier (such as an oligonucleotide) for the therapeutic treatment of uncontrolled cellular specifically, the proliferation. More present with invention is concerned the prevention restenosis by intravascular delivery of radiolabeled DNA carrier at a dilatation site of an artery. invention is also directed to a method of treatment of proliferative diseases and/or vascular proliferative disorders such as cancer and related metastasis. More particularly, the invention relates to the preparation of DNA sequences carrying one or several radioisotopes, located within the DNA sequence, and which are able to prevent cell proliferation in vitro and, pursuant to local drug delivery and/or drug delivery, are able to prevent cell systemic proliferation in vivo, more particularly restenosis and In other words, the malignant tumors. invention relates to the synthesis process, the stability data of the radiolabeled DNA carrier, the efficacy of the invention in vitro, in cell culture, and the in vivo delivery of the molecule.
